SKNore

AI Deny-List Policy Layer • Secret & Protected File Exfiltration Guard

FAIR MARKET ASSET VALUE (DECISIVE)

$175,000 USD

Evidence: SKNore.zip (architecture + product surface spec)

Executive Summary

ASSET	EVIDENCE PACKAGE
SKNore — Deny-List Policy Layer	**SKNore.zip (2 docs)**
VALUATION (DECISIVE)	LEDGER
$175,000 USD	**Tentative / Unverified**

> Evidence quality: this ZIP contains the module's architecture and product surface specification (no source code). The valuation assumes a standard implementation consistent with the stated wiring paths and endpoints. Providing a code bundle and/or smoke evidence for policy CRUD + generate blocking would justify an upward re-rate.

SKNore is a deny-list policy layer designed to prevent protected files (secrets, keys, environment files, private certificates, sensitive directories) from ever being included in AI generation payloads or export surfaces.

From an enterprise buyer's point of view, SKNore is a Data Loss Prevention (DLP) primitive for developer tooling: it reduces the risk of secret exfiltration through prompt context, keeps governance explicit and user-controlled, and creates audit evidence when a request is blocked.

Decisive Valuation Statement

Fair market asset value for SKNore (as specified in the provided architecture + product surface documentation) is $175,000 USD. This figure is determined from a replacement-cost floor, then uplifted for operationalization (enforcement + audit posture) and ecosystem distribution (multi-tenant SuperIDE / gateway adjacency).

Primary Value Drivers

- Compliance-grade story: explicit policy, enforced behavior, and audit events for blocked attempts.
- Integration leverage: one policy layer protects every AI call routed through the standard /api/kaixu-generate lane.
- High trust ROI: secret leakage prevention is a gating concern for B2B procurement (security reviews, SOC2 narratives).
- Low friction adoption: glob-based patterns are intuitive; no SKNore-specific env vars required in v1.0.0.

Deep Scan — What Exists in the Package

Artifact	Bytes	Lines	SHA-256 (prefix)
ARCHITECTURE.md	1,147	38	7e153a6a4835c53d…
PRODUCT_SURFACE.md	1,006	33	3582cc3bdcf29cfc…

> This scan is constrained to what was provided in SKNore.zip. It documents a real module surface, but does not include the implementation code for src/sknore/* or the Netlify functions.

Functional Claims Captured from the Docs

- Policy model: Input is glob-like path patterns (one per line). Examples include .env, .env.*, secrets/**, **/*.pem, **/*.key. Policy is intended to be human-readable and easy to audit.
- Current wiring (stated): Frontend policy parser/filter lives in src/sknore/policy.ts with local persistence under key kx.sknore.patterns. AI request gating is integrated in src/App.tsx inside runGenerate and smoke-generate flows.
- Enforcement rules: 1) If the active file is protected, generation is blocked. 2) Protected files are stripped from the files payload before /api/kaixu-generate. 3) Smoke generate follows the same filtered payload behavior.
- Product surface (v1.0.0): Standalone UI surface at public/SKNore/index.html (static deploy). Backend endpoints: GET/POST policy CRUD plus GET events for blocked attempts. Enforcement occurs on /api/kaixu-generate with server-side policy resolution.
- Hardening roadmap: Recommended next steps include server-side enforcement (to prevent client bypass), org-level storage in DB, and emitting SKNore audit events whenever a request is blocked.

Threat Model Coverage (Intended)

Threat model coverage (intended): accidental inclusion of secrets in prompt context; clipboard/paste patterns; workspace export flows that bundle sensitive material; and team-scale safety where different developers have different access levels. SKNore is a deny-by-policy mechanism; it is not a replacement for secret scanning, repo hygiene, or key rotation.

Architecture — Enforcement Flow (Target State)

- User sets SKNore patterns (globs) in the SKNore UI.
- Client loads the resolved policy (local + org/workspace policy).
- Before any generate call, activePath is checked. If protected, the request is blocked.
- All files included in the generate payload are filtered. Protected paths are removed from the files array.
- Server-side /api/kaixu-generate repeats enforcement: resolves policy, blocks protected activePath, strips protected files.
- When a block occurs, an audit event is emitted and exposed via /api/sknore-events.

Backend API Surface (as specified)

Method	Endpoint	Purpose
GET	/api/sknore-policy-get	Load org/workspace policy
POST	/api/sknore-policy-set	Save org/workspace policy
GET	/api/sknore-events	Return blocked-event stream (audit-backed)
POST	/api/kaixu-generate	Generate with enforced SKNore checks + payload stripping

Hardening Notes

- Server-side enforcement is mandatory to prevent a client-side bypass.
- Org-level policy storage belongs in an org_settings table or a dedicated sknore_policies table.
- Audit events should include: actor, org/workspace, timestamp, activePath, blockedPatterns, requestId, and model.
- Pair SKNore with secret scanning and key rotation (defense in depth).

Valuation Model (Decisive)

This valuation is an asset valuation for the SKNore module as a sellable security add-on inside the SOLEnterprises ecosystem. It uses a replacement-cost floor, then applies premiums for operationalization and ecosystem distribution. It avoids speculative bargain ranges and treats functional governance code as premium.

Replacement Cost Floor

Component	Hours	Cost Basis (@$250/hr)
Policy engine (glob compile + file filtering)	35	$8,750
Standalone UI surface (SKNore page + UX copy)	35	$8,750
Policy persistence (local + org/workspace)	30	$7,500
Backend CRUD endpoints + DB wiring	45	$11,250
Enforcement in /api/kaixu-generate	30	$7,500
Audit events + events endpoint	35	$8,750
Smoke tests + release gate checks	30	$7,500
Docs + versioning + deploy notes	15	$3,750
TOTAL replacement-cost floor	**255**	**$63,750**

Premiums (Canon Required)

Premium	Why it applies	Amount
Operational proof / operationalization premium	Enforcement + audit posture reduces risk for buyers and unlocks enterprise security initiatives.	$56,250
Ecosystem / footprint premium	Value uplift from multi-app distribution, multi-tenant posture, and the SOLEnterprises ecosystem-wide operat	$55,000
FINAL fair market asset value		**$175,000 USD**

> Re-rate trigger: provide the SKNore implementation code and a smoke report for policy CRUD + generate blocking. With verified enforcement and audit logs in production, SKNore becomes a stronger enterprise feature add-on and the valuation should move upward.
